

Agile Release Summary 1

Complete Navigation Diagram

- This part shows the relationship between different pages and how users can navigate between them, making it easier for users to make their reservations.

Record Demo Video

- Bin has made a demo video demonstrating the functionalities of the website. It shows how to navigate and proceed on the website from the perspective of a normal user.

Complete Use Case Description and Diagram

- We have defined 8 use cases and created corresponding diagrams to showcase their relationships. This helps the team align better in future coding and development.

Complete Design Level Sequence Diagram

- On a design level, we have drawn system sequence diagrams for the "make a reservation" and "cancel a reservation" use cases. These diagrams are the core of the business logic for the entire website, forming the basis for all other use cases.

Complete Output Design

- This document outlines the system's outputs when users check their reservations, helping users understand how to interact with the website.

Complete Most of the UI Design Prototypes

- The prototypes are detailed and well-designed, including:
 - Sign up page
 - Log in page
 - Home page
 - Trail details page
 - Weather page
 - My order page

In the developing and coding phase going forward, we will follow these designs to ensure we stay on the right track.
